/note="Vector: pBACWICH; Site_1: HindIII; Site_2: HindIII;
Rice blast is one of the most devestating fungal diseases
of rice world wide. It is a filamentous ascomycete with
a haploid genome (n=7) of approximately 40 Mbp. Rice
blast is an important model fungal pathogen for studying
numerous aspects of the fungal-host interaction. In
order to facilitate genome with an average insert size of 130
kbp was constructed. This library represents greater
than 25x genome coverage. High density colony filters
are available upon request."

// Rice blast is one of the most devestating fungal diseases of rice world wide. It is a filamentous ascomycete with a haploid genome (n-7) of approximately 40 Mbp. Rice blast is an important model fungal pathogen for studying numerous aspects of the fungal-host interaction. In order to facilitate genome wide analysis, a BAC library containing 9216 clones with an average insert size of 130 kbp was constructed. This library represents greater than 25% genome coverage. High density colony filters are available upon request.

Rice blast is one of the most devestating fungal diseases of rice world wide. It is a filamentous ascomprete with a haploid genome (n=7) of approximately 40 Mpp. Rice blast is an important model fungal pathogen for studying numerous aspects of the fungal-host interaction. In order to facilitate genome wide analysis, a BAC library containing 9216 clones with an average insert size of 130 kbp was constructed. This library represents greater than 25X genome coverage. High density colony filters are available upon request. "3 others

/note="Vector: pBACWICH; Site_l: HindIII; Site_2: HindIII;
Rice blast is one of the most devestating fungal diseases
of rice world wide. It is a filamentous ascomycete with
              blast is an important model fungal pathogen for studying numerous aspects of the fungal-host interaction. In corder to facilitate genome wide analysis, a BAC library containing 9216 clones with an average insert size of 130 kbp was constructed. This library represents greater than 25% genome coverage. High density colony filters are available upon request."

```
a haploid genome (n=7) of approximately 40 Mbp. Rice blast is an important model fungal pathogen for studying numerous aspects of the fungal host interaction. In order to facilitate genome wide analysis, a BAC library containing 9216 clones with an average insert size of 130 kbp was constructed. This library represents greater than 25x genome coverage. High density colony filters are available upon request."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note="Vector: pBACWICH; Site_1: HindIII; Site_2: HindIII; Rice blast is one of the most devestating fungal diseases

of rice world wide. It is a filamentous ascomycete with a haploid genome (n=7) of approximately 40 Mbp. Rice blast is an important model fungal pathogen for studying numerous aspects of the fungal-host interaction. In order to facilitate genome wide analysis, a BAC library containing 9216 clones with an average insert size of 130 kbp was constructed. This library represents greater than 25% genome coverage. High density colony filters are available upon request. 3 others

/note="Vector: Dargaments Site_1: HindIII; Site_2: HindIII; Rice blast is one of the most devestating fungal diseases of rice world wide. It is a filamentous ascomycete with a haploid genome (n=7) of approximately 40 Mbp. Rice blast is an important model fungal pathogen for studying numerous aspects of the fungal host interaction. In order to facilitate genome wide analysis, a BAC library containing 9216 clones with an average insert size of 130 kbp was constructed. This library represents greater than 25x genome coverage. High density colony filters are available upon request." I others

                                             This sequence encodes the consensus phytase-10-thermo(3)-050T-K91A. The invention relates to a process for preparing animal feed by saglomerating feed ingredients with a thermostable phytase, which a added before or during agglomeration. The thermostable phytase is useful for expression in transgenic plants. These plants are useful in the preparation of animal feed itself. The thermostable phytase allows animal feed to be produced more efficiently, in addition to improved phytase-expressing transgenic plants. These plants provide a feed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  attaagttotacagaagatacaaggotttggctagaaagattgttocattcattagagot 480

ytases with improved properties such as temperature stability, ity and substrate specificity, for use in pharmaceuticals and Novel phytases with improved compound foods and feeds stabi

Claim 10; Fig 8a-c; 240pp; English.

The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, pH stability, pH profile, temperature profile, substrate binding, position specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, pharmaceutical compositions or compound food or feeds rhe feed can be used to reduce levels of phytate in animal manner, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate. The present sequence encodes a phytase sequence from the present

```
The invention relates to a novel stabilised dry or liquid enzyme formulation, comprising phytase (myo-inositol hexakisphosphate phytase) and one or more stabilishing agents including phytase (myo-inositol hexakisphosphate) physphothylene glycols with a molecular weight of to 4000 ba, preferably 1000 to 350 ba; the disodium salts of malonic, to 4000 ba, preferably 1000 to 350 ba; the disodium salts of malonic, and succinic acid; carboxymethyleellulose; and sodium alginate. The stabilised phytase formulation is used in a method for preparing a red composition for monogastric animals (e.g., pigs, poultry) and provides a monogastric animal with its dietary requirements of phosphorus. Although a large amount of phosphate is present in animal ced in the form of phytate phosphorus, monogastric animals are unable to utilise this form of phosphate, resulting in the addition of extra phosphate to the feed of such animals. Phytase enhances the nutritional value of plant material without the need for adding additional phosphate to the feed of such animal feed, as the animal can make use of the inorganic phosphate liberated from phytate phosphorus using the enzyme. The phytase formulation of the invention has an improved enzyme. The phytase formulation of the invention has an improved contained the proposition of the invention of the particle of participal entring long-term storage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and pelleting. The present sequence represents DNA encoding a mutant phytase-10 consensus sequence, phytase-10-thermo[3]-050T-K91A, which has a temperature optimum and melting point 4 degrees Celsius higher than that of phytase-10 (AAY69566). Its specific activity with phytate as a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               and can withstand feed processing methods such as extrusion, expansion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New stabilized enzyme formulation, useful for feed compositions for

temperature stability, in pharmaceuticals and phytases with improved properties such as ability and substrate specificity, for use compound foods and feeds stability Novel

Disclosure; Fig 25a-c; 240pp; English.

The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, pH stability, pH profile, temperature profile, specific activity, substrate specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, and end level of released phosphate. The phytases can be used to produce 

```
pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manure, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate.
                                                                                                                                                                          240

increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, pH stability, pH profile, temperature profile, specific activity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, and end level of released phosphate. The phytases can be used to produce pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manure, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate. The present sequence encodes a phytase sequence from the present

formulation, comprising phytase (myo-inositol hexakisphosphate phosphohydrolase) and one or more stabilisting agents including phosphohydrolase) and one or more stabilisting agents including thosphohydrolase) and one or more stabilisting agents including to yield or tribitol; pulyethylene glycols with a molecular weight of 600 to 4000 Da, preferably loud to 3550 Da; the disodium salts of malonic, attabilised phytase formulation is used in a method for preparing a read stabilised phytase formulation is used in a method for preparing a provides a monogastric animals (e.g., pigs, poultry) and provides a monogastric animals (e.g., pigs, poultry) and provides a monogastric animal with its dietary requirements of phosphate is present in animal feed in the form of phytate phosphorus, monogastric animals are unable to utilise this form of phosphate, resulting in the addition of extra phosphate to the feed of such animals. Phytase enhances the nutritional value of plant material without the need for adding additional phosphate cot the feed. The level of phosphate pollution in the environment is reduced by adding phytase to animal feed, as the animal can make use of the inorganic phosphate liberated from phytate phosphorus animals of the inorganic phosphate liberated from phytate phosphorus animals of animal can make use of the inorganic phosphate liberated from phytate phosphorus animal can make use of the inorganic phosphate liberated from phytate phosphorus animal can make an animal can withstand feed processing methods such as extrusion, expansion and animals of an withstand feed processing methods and with a solution of each an animal can withstand feed processing methods and can withstand feed processing methods are animals of an animal can make animals animals and animals animals animals and animals animals and animals and animals and animals and animals and animals animals and animals animals and animals animals and animals and animals animal

QΫ́

The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, pH stability, pH profile, temperature profile, substrate specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, and end level of released phosphate. The phytases can be used to produce pharmaccutical compositions or compound food or feeds. The feed can be

```

```
This sequence encodes the consensus phytase-1-thermo(8)-050T-K91A. The invention relates to a process for preparing animal feed by agglomerating feed ingredients with a thermostable phytase, which is added before or during agglomeration. The thermostable phytase is useful for expression in transgenic plants. These plants are useful in the preparation of animal feed itself. The thermostable phytase allows animal feed to be produced morre efficiently, in addition to improved phytase-expressing transgenic plants. These plants provide a feed

temperature stability, in pharmaceuticals and such as t for use i Novel phytases with improved properties stability and substrate specificity, compound foods and feeds -

Claim 10; Fig 7a-c; 240pp; English

The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, pH stability, pH profile, temperature profile, specific activity, substrate specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manner, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate. The present sequence encodes a phytase sequence from the present

formulation, comprising phytase (myo-inositol hexakisphosphate phosphohydrolase) and one or more stabilising agents including xylitol or ribitol; polyethylene glycols with a molecular weight of 600 to 4000 Da, preferably 1000 to 3350 Da; the disodium salts of malonic, glutaric and succinic acid; carboxymethylcellulose; and sodium alginate. The stabilised phytase formulation is used in a method for preparing a feed composition for monogastric animals (e.g., pigs, poultry) and provides a monogastric animal with its dietary requirements of phosphorus. Although a large amount of phosphate is present in animal to utilise this form of phystate phosphorus, amongastric animals are unable to utilise this form of phosphate, resulting in the addition of extra phosphate to the feed of such animals. Phytase enhances the nutritional value of plant material without the need for additional phosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               to the feed. The level of phosphate pollution in the environment is reduced by adding phytase to animal feed, as the animal can make use of the inorganic phosphate liberated from phytate phosphorus using the enzyme. The phytase formulation of the invention has an improved thermostability and can therefore remain stable during long-term storage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      phytase-1 consensus sequence, phytase-1-thermo(8]-050T-K91A, which has a temperature optimum and melting point 7 degrees Celsius higher than that of phytase-1 (AAY69558).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          and pelleting. The present sequence represents DNA encoding a mutant phytase-1 consensus sequence, phytase-1-thermo[8]-Q50T-K91A, which has a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            can withstand feed processing methods such as extrusion, expansion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New stabilized enzyme formulation, useful for feed compositions for monogastric animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel stabilised dry or liquid enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                   /product= "Phytase-1-thermo[8]-Q50T-K91A"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 1404 BP; 329 A; 319 C; 304 G; 452 T; 0 other;

The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, pH stability, pH profile, temperature profile, specific activity, substrate specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, and end level of released phosphate. The phytases can be used to produce used to reduce levels of phytate in animal manure, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate. The present research research and phytase sequence from the present Disclosure; Fig 23a-c; 240pp; English.

New variant phytase enzymes, used for liberating phosphorus from a phytase substrate, for reducing phytate levels in animal manure and in feed and food preparations -

Disclosure; Fig 9f-g; 141pp; English.

This sequence encodes the consensus Ascomycete phytase sequence.
The invention relates to variant phytase enzymes with specific amino acid substitutions for improved properties. The phytase variants can be used for liberating phosphorus from a phytase substrate. They can be used for reducing phytate levels in animal manure. They can be used in feed or food preparations. The phytase DNA can also be used to produce transgenic plants which can be used in feeds or foods. The phytase variants can also be used in soy processing and in the manufacture of inositiol or be used in soy processing and in the manufacture of inositiol or stability, temperature stability, phy profile, temperature profile, specific activity (in particularly in relation to pH and temperature), substrate specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytase degradation rate and end level of released phosphate reached.

This invention describes a novel process for the preparation of a consensus protein. The specific example given in the specification is that of a fungal phytase (myo-inositol hexakisphosphate) which hydrolyses phytase to valuable feed additives, with a fully defined amino acid sequence given in the specification, or variant or mutein. The method is useful for improving protein properties by altering their sequence. The consensus protein and mutein are useful in food, feed or pharmaceutical compositions. This sequence encodes the consensus phytase protein used in the method of the invention.

Lehmann M;

WPI; 2000-491161/43 P-PSDB; AAB20515 'el phytases with improved properties such as temperature stability, stability, and substrate specificity, for use in pharmaceuticals and compound foods and feeds Novel

Example 9; Fig 2a-c; 240pp; English.

The present invention describes improved phytases, preferably with increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, pH stability, pH profile, temperature profile, specific activity, substrate specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, and end level of released phosphate. The phytases can be used to produce used to reduce levels of phytate in animal manner, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate. The present sequence encodes a phytase sequence from the present invention

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The invention relates to a process for preparing animal feed by agglomerating feed ingredients with a thermostable phytase, which is added before or during agglomeration. The thermostable phytase is useful for expression in transgenic plants. These plants are useful in the preparation of animal feed itself. The thermostable phytase allows animal feed to be produced more efficiently, in addition to improved phytase-expressing transgenic plants. These plants provide a feed additive (phytase) simultaneously.
  This sequence represents the consensus phytase-10-thermo(3)-Q50T-K91A.

increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, pH stability, pH profile, temperature profile, specific activity, substrate especificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, and end level of released phosphate. The phytases can be used to produce pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manure, by converting it into lower inositol phosphates and/or inositol and inorganic phosphate. The present sequence represents a phytase sequence from the present Novel phytases with improved properties such as temperature stability, pH stability and substrate specificity, for use in pharmaceuticals and 61 SAISPDVPKGCRVTFVQVLSRHGARYPTSSASKAYSALIEAIQKNATAFKGKYAFLKTYN 120 61 saispdvpkgcrvtfvqvlsrhgaryptssaskaysalieaiqknatafkgkyaflktyn 120 121 YTLGADDLTPFGEQOMVNSGIKFYRRYKALARKIVPFIRASGSDRVIASAEKFIEGFOSA 180 KLADPGANPHQASPVINVIIPEGAGYNNTLDHGLCTAFEESELGDDVEANFTAVFAPPIR 240 ARLEAHLPGVNLTDEDVVNLMDMCPFDTVARTSDATQLSPFCDLFTHDEWIQYDYLQSLG 300 HDNTMVSIFFALGLYNGTKPLSTTSVESIEETDGYSASWTVPFAARAYVEMMQCEAEKEP 420 hdntmvsiffalglyngtkplsttsvesieetdgysaswtvpfaarayvemmqceaekep 420 KYYGYGAGNPLGPAQGVGFVNELIARLTHSPVQDHTSTNHTLDSNPATFPLNATLYADFS 360 Gaps 1 MGVFVVLLSIATLFGSTSGTALGPRGNSHSCDTVDGGYQCFPEISHLWGTYSPFFSLADE 60 The present invention describes improved phytases, preferably with ; Score 2468; DB 21; Length 467; Pred. The invention relates to a novel stabilised dry or liquid enzyme formulation, comprising phytase (myo-inositol hexakisphosphate phosphorydrolase) and one or more stabilising agents including xylitol or ribitol: polyethylene glycols with a molecular weight of 600 to 4000 Da, preferably 1000 to 3350 Da; the disodium salts of malonic, glutaric and succinic carboxymethylcellulose; and sodium alginate. The stabilised phytase formulation is used in a method for preparing a feed composition for monogastric animals (e.g., pigs, poultry) and provides a monogastric animal with its dietary requirements of phosphorus. Although a large amount of phosphorus is present in animal feed in the form of phytate phosphorus, monogastric animals are unable to utilise this form of phosphate, resulting in the addition of extra

;
phosphate to the feed of such animals. Phytase enhances the nutritional value of plant material without the need for adding additional phosphate to the feed. The level of phosphate pollution in the environment is reduced by adding phytase to animal feed, as the animal can make use of the inorganic phosphate liberated from phytate phosphorus using the enzyme. The phytase formulation of the invention has an improved thermostability and can therefore remain stable during long-term storage and can withstand feed processing methods such as extrusion, expansion and pelleting. The present sequence represents a mutant phytase-10 consensus sequence, phytase-10-thermo[3]-050T-K91A, which has a temperature optimum and melting point 4 degrees Celsius higher than that of phytase-10 (AAX69566). Its specific activity with phytate as a substrate is also strongly increased.

and pelleting. The present sequence represents a consensus sequence, designated phytase-10, which was derived from the mature phytase aguences from a variety of fungi (AANF0544, AANF0548, AANF05563 and AANF05564) and the Basidiomycetes phytase consensus AAXF05563 and additionally contains the Aspergillus terreus cbs116.46 signal peptide at
  feed composition for monogastric animals (e.g., pigs, poutry) and provides a monogastric animals (e.g., pigs, poutry) and provides a monogastric animal with its dietary requirements of phosphorus. Although a large amount of phosphorus is present in animal feed in the form of phystate phosphorus, monogastric animals are unable to utilise this form of phosphorus, monogastric animals are unable phosphate to the feed of such animals. Phytase enhances the nutritional value of plant material without the need for adding additional phosphate to the feed. The level of phosphate pollution in the environment is reduced by adding phytase to animal feed, as the animal can make use of the incorpus of phosphate pollution in the animal can make use of the incorpus of phosphate formulation of the invention has an improved thermostability and can therefore remain stable during long-term storage
   The invention relates to a novel stabilised dry or liquid enzyme formulation, comprising phytase (myo-inositol hexakisphosphate phosphohydrolase) and one or more stabilising agents including xylitol; polyethylene glycols with a molecular weight of 600 to 4000 Da, preferably 1000 to 3350 Da; the disodium salts of malonic, glutaric and succinic acid; carboxymethylcellulose; and sodium alginate. The stabilised phytase formulation is used in a method for preparing a

This sequence represents the consensus phytase-1-thermo(8)-050T-K91A. The invention relates to a process for preparing animal feed by agglomerating feed ingredients with a thermostable phytase, which is added before or during agglomeration. The thermostable phytase is useful for expression in transgenic plants. These plants are useful in the preparation of animal feed itself. The thermostable phytase allows animal feed to be produced more efficiently, in addition to improved phytase-expressing transgenic plants. These plants provide a feed ingredient and a feed additive (phytase) simultaneously.

The invention relates to a novel stabilised dry or liquid enzyme formulation, comprising phytase (myo-inositol hoxakisphosphate) to physphohydrolase) and one or more stabilising agents including to physphohydrolase) and one or more stabilising agents including to the phosphohydrolase) and one or more stabilising agents including to 4000 Da, preferably 1000 to 3350 Da; the disodium salts of malonic, of glutaric and succinic acid; carboxymethylcellulose; and sodium alginate. The stabilised phytase formulation is used in a method for preparing a provides a monogastric animal with its dietary requirements of phosphorus. Although a large amount of phosphate is present in animal teed in the form of phytate phosphorus, monogastric animals are unable to utilise this form of phytate phosphorus, monogastric animals are unable to the feed of such animals. Phytase enhances the nutritional phosphate to the feed of such animals. Phytase enhances the nutritional phosphate to the feed of such animals. Phytase enhances the nutritional content of phosphate liberated from phytate phosphorus using the reduced by adding phytase to animal feed, as the animal can make use of the inorganic phosphate liberated from phytate phosphorus using the enzyme. The phytase formulation of the invention has an improved thermostability and can therefore remain stable during long-term storage and can withstand feed processing methods such as extrusion, expansion and pelleting. The present sequence represents a mutant phytase-I consensus sequence, phytase-I-thermof81-050T-K91A, which has a that that that that the consensus sequence of phytase-I-thermof81-050T-K91A, which has a

increased thermostability, and methods for producing them. The methods can be used for producing phytases with improved properties e.g. temperature stability, ph stability, ph profile, temperature profile, specific activity, substrate specificity, substrate cleavage pattern, substrate binding, position specificity, the velocity and level of release of phosphate from corn, reaction rate, phytate degradation rate, and end level of released phosphate. The phytases can be used to produce pharmaceutical compositions or compound food or feeds. The feed can be used to reduce levels of phytate in animal manure, by converting it into lower inositol phosphates. The present sequence represents a phytase sequence from the present

consensus protein. The specific example given in the specification is that of a fungal phytase (myo-inositol hexakisphosphate) which hydrolyses phytase to valuable feed additives, with a fully defined amino acid sequence given in the specification, or variant or mutein. The method is useful for improving protein properties by altering their sequence. The consensus protein and mutein are useful in food, feed or pharmaceutical compositions. This sequence is a mutant phytase protein of the invention which does not appear in the specification but has been created from the protein represented in AAW93380.
